## seadiver.model

class ANN (input\_shape, structure, output, activation= "sigmoid", loss = "auto",
initializer = "auto", strict=False, delta=1e-7)

## Attributes

Name	Туре	Description	
w_layers	list	weights	
b_layers	list	biases	
activations	list	activation function names	
input_shape	tuple	the shape of a single input data	
initializer	String	the type of the initializer	
output	String	the type of the output function	
loss	String	the type of the loss function	
structure	tuple	the number of neurons in each layer	
strict	boolean	whether to apply strict arithmetic calculations (for 'softmax' layer)	
delta	float	a small number for preventing "division- by-zero" error	
w_gradients	list	the most recent gradients for weight layers	
b_gradients	list	the most recent gradients for bias layers	
fan_ins	list	the most recent affine results	
fan_outs	list	the most recent activation results	
error_log	list	the most recent error_log	

## Method

Name	Arguments	Return	Description	
------	-----------	--------	-------------	--

describe()			prints model information
params()			prints a list of compatible parameters
forward()	x, t, display= False	out, error, batch_size	forward propagation and loss calculation
backward()	y, t, batch_size, display= False	w_gradients, b_gradients	backward propagation
train()	x, t, learning_rate, iteration, save_log= False, flush_log= True, display= True, error_round= 10		trains a model
<pre>predict()</pre>	Х	out	returns forward propagation output
export()	Directory= r".\\", file_name= None, include= "essential"		saves the object in '.json' format. pass the model's destinated folder path for 'directory' argument. 'file_name' will be initialized to "model_{current-time}.json" by default. compatible parameters for 'include' are {'all', 'essential', 'error_log', 'gradients', 'fan_io'}.
<pre>vis_error_ log()</pre>			draw a lineplot with the 'error_log'
<pre>vis_inner_ dist()</pre>			draw a histogram of the model's inner distribution per layer

## Methods

Name	Arguments	Returns	Description
make()	io		creates a model from a .json file
